

# Re-hydration

- Re-hydration is also possible to increase grain moisture by a couple of points, given enough time and with the right quality and volume of air.
- Starting at 10% moisture content, this IntegrisPro-Model result is based on IntegrisPro running fans only when the EMC is between 12 and 17%, to shoot for a 13.0% average moisture content at completion.
- Starting from Sensor 1 at the bottom of the bin, a 4% gain for a 14% final moisture content is achieved.
